

SensorSDK Software DEVELOPMENT KIT

Fast integration of our Spectral Sensors
into your measurement systems.

The Software Developments Kit (SDK) provides you with the relevant hands-on tools to build your own software to control spectral sensors and light sources. With just a few clicks, you can connect Spectral Engines' products to your own measurement systems and save time.

The SDK contains a comprehensive description of the serial communication protocol. The protocol description gives you the freedom to implement the commands into any other programming language. With the communication protocol, it is straightforward to integrate spectral sensors into embedded platforms.

Example code samples are provided for Labview™, C#, Android and Python to get your development started.

Benefits

- Quick start for your software development
- Comprehensive documentation
- 1 year of free updates and support

Key features

- Manual and command descriptions
- Full communication protocol
- Labview™, C#, Android and Python code samples

DESCRIPTION OF CONTENTS

General description

Electrical interface

Pin description

UART Communication interface

Sensor info commands
Check device response
Get device info
Get sensor type
Get sensor hardware version
Get serial number
Get sensor minimum wavelength
Get sensor maximum wavelength
Get firmware version
Basic measurement parameters
Set wavelengths for the measurement scan
Get sensor wavelength from array index
Get number of wavelengths in control array
Set wavelength average and scan average
Get wavelength average and scan average parameters
Get estimated time for the measurement scan
Get estimated time for reference measurement scan
Get estimated time for dark measurement scan
Set light source power level
Get light source power level
Set light source control mode
Get light source control mode
Set light source warm-up time
Get light source warm-up time
Advanced measurement parameters
Set automatic Dark mode
Get automatic dark mode
Set dark subtraction mode
Get dark subtraction mode
Set divide mode
Get divide mode
Set logarithm mode
Get logarithm mode
Set scaling function A
Get scaling function A
Set moving average
Get moving average
Set derivative order
Get derivative order
Set scaling function B
Get scaling function B
Save measurement parameters to index
Load measurement parameters from index
Load default measurement parameters
Measurement
Start a measurement scan
Read measurement result
Start a reference measurement
Read reference measurement result
Start a dark measurement scan
Read dark measurement result I2C

Communication interface

I2C command register write
I2C command register read
I2C sensor info registers
Sensor type
Hardware version
Serial number
Minimum wavelength
Maximum wavelength
Firmware version
I2C basic measurement parameters
Data access index
Data access length
Wavelength array
Number of wavelengths
Wavelength average
Scan average
Measurement time
Reference measurement time
Dark measurement time
Lamp power level
Lamp control mode
Lamp warm-up time
I2C advanced measurement parameters
Automatic dark
Dark subtraction
Divide
Logarithm
Scale 1
Moving average
Averaging width
Derivative
Scale 2
Save measurement parameters to memory index
Load parameters from memory index
Load default parameters
I2C measurement
Measure spectrum
Measurement result array
Measure reference spectrum
Reference result array
Clear reference spectrum
Measure dark spectrum
Dark measurement result array
Clear dark spectrum
Read temperature

Measurement flow chart

Basic measurement procedure
Set measurement wavelengths
Set wavelength average and scan average
Set light source intensity level
Measure
Read result
Turn light source off
